

ZKBioGo APP Pre Setup

To add a panel to the ZKBioGo App a public IP address must be assigned to the site router (done with internet provider) and needs to be port forwarded to the panel's static IP address/Port (ex: internal IP 192.168.1.201:4370)

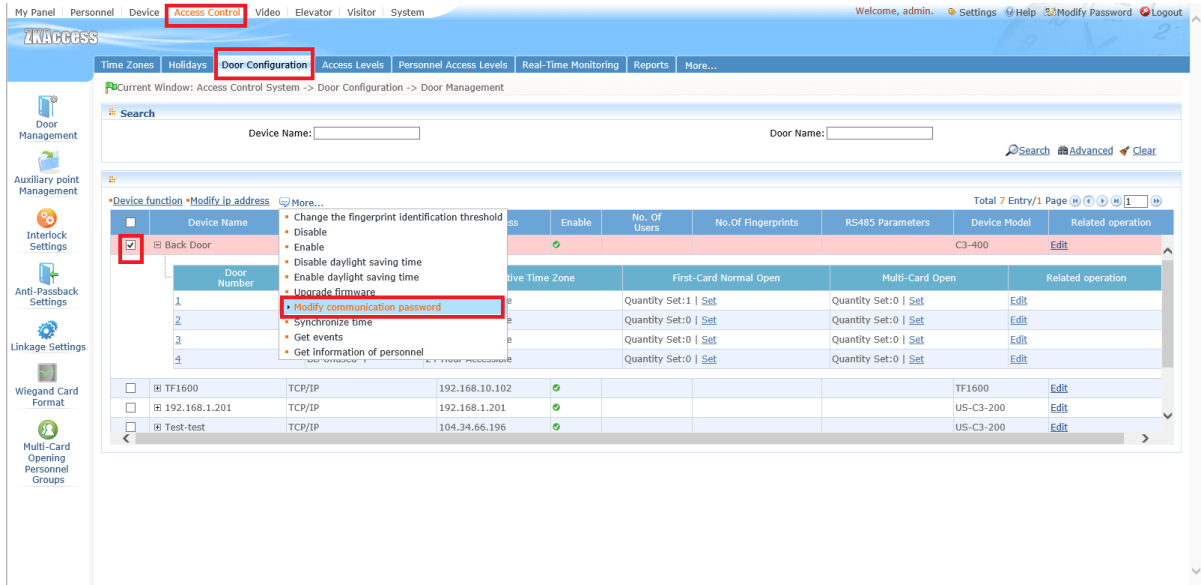

(ex: external IP 46.86.24.***)

Out of Network Software Remote Setup

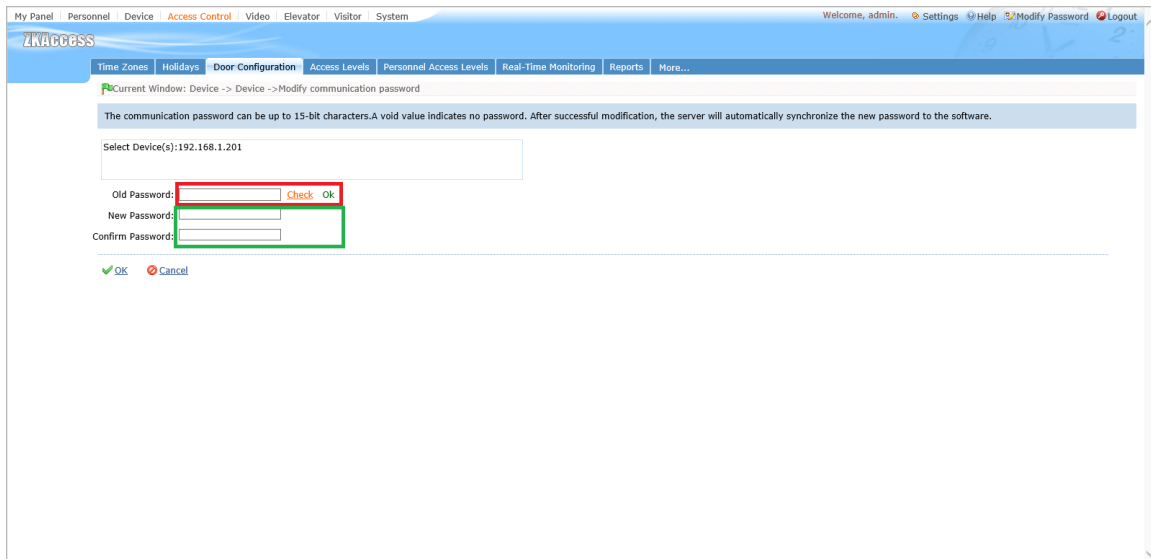

1. Install ZKAccess 5.2 Software on the remote PC.
2. Determine the Static Public IP address of your router or ask your internet service provider to provide one and configure it to your router. (Ex. 173.35.74.160)
3. Choose unique ports for each panel and forward those ports using the router to make them available to the remote PC. (Default: 4370)
4. To manage the panels from a remote PC, open up ZKAccess 5.2 Software and manually add the panel. Instead of the panel IP address use the router's static IP Address and the port of the panel (Ex. IP Address: 173.35.74.160, IP Port No: 4370)

Note: Comm password needs to be setup on the panel through the ZKAccess software (for security purposes) to add a panel to the app

Old password (blank) click OK. New password (ex:1234)

Please Add the public IP Address and the Comm password to ZKBioGo in the sections below.
